## RELATIVE HUMIDITY AIR AND SUBSTRATE TEMPERATURE DATA

Relation between Dew Point, Air Temp
\& Relative Humidity

The table below may be used as an accurate guide to determine the dew-point and the "no painting" conditions near or below the dew-point in ambient air temp conditions between $5 \& 30^{\circ} \mathrm{C}$. However, unless temperature differences (air to surface) are obvious, this table does require a surface temperature gauge. For safe painting conditions the surface temp should be $3^{\circ} \mathrm{C}$ above dew-point. Simple and accurate testing for safe dew-point conditions is easily carried out by wetting the surface with clean water; if the water dries off within 10 minutes the subject surface temperature is above the dew-point and suitable to paint.
